Acknowledgements

This report highlights the trainings and screenings of the *Preventing Water Quality Contamination through the Texas Well Owner Network* project, funded by the federal Clean Water Act 319(h) Nonpoint Source grant provided by the Texas State Soil and Water Conservation Board and U.S. Environmental Protection Agency to Texas A&M AgriLife Extension Service's Texas Water Resources Institute in partnership with the Departments of Soil and Crop Sciences and Biological and Agricultural Engineering at Texas A&M University.

Special acknowledgement is given to:

- Well owners who invested their time to attend the Texas Well Owner Network trainings and screenings
- U.S. Environmental Protection Agency and Texas State Soil and Water Conservation Board for providing support for these efforts.
- AgriLife county Extension agents for their support and coordination
- Watershed coordinators and river authorities for their participation and presenting local watershed information.
- Groundwater conservation districts for presenting information on local groundwater conditions and challenges

Executive Summary

The Texas A&M AgriLife Extension Service (AgriLife Extension) through the Departments of Soil and Crop Sciences (SCSC) and Biological and Agricultural Engineering (BAEN) and the Texas Water Resources Institute (TWRI) conducted 14 well owner trainings and 43 well owner screenings throughout the state of Texas through the TSSWCB project 10-04 “*Preventing Water Quality Contamination through the Texas Well Owner Network*” funded through a Clean Water Act 319(h) nonpoint source grant from the Texas State Soil and Water Conservation Board (TSSWCB) and the U.S. Environmental Protection Agency (EPA).

Private well owners are independently responsible for monitoring the quality of their well water, and they are frequently at greater risk for exposure to compromised water quality. Since management and protection of private, domestic and irrigation water sources are under the control of the landowner, they depend primarily on education rather than regulation to protect their well water.

To help in educating landowners about well water quality testing, protection and management, TWRI, SCSC and BAEN, parts of AgriLife Extension at Texas A&M University, developed the Texas Well Owner Network (TWON) with the funding and support from TSSWCB and EPA. TWON was designed to deliver science-based, community-responsive education curriculum and focused on protecting groundwater quality and aquifer integrity.

TWON trained Texans regarding water quality and best management practices for protecting wells and surface waters, which will avert off-site transport of contaminants (bacteria and nutrients) to surface waters, prevent contamination of underlying aquifers and safeguard the water quality and health of landowners and their families.

TWON is an effective tool used in support of watershed protection planning and total maximum daily load implementation efforts where investigations indicate bacterial and nutrient contributions. This was achieved by (1) development of TWON curriculum; (2) delivery of TWON educational materials and trainings; and (3) evaluation and assessment of the program so needed modifications and improvements could be made.

Introduction

More than 1,000,000 private water wells in Texas provide water to citizens in rural areas and increasingly, to those living on small acreages at the burgeoning rural-urban interface. Public drinking water supplies are generally of good quality and are monitored through requirements of the federal Safe Drinking Water Act; however, private well owners are independently responsible for monitoring the quality of their wells and frequently at greater risk for exposure to compromised water quality. Management and protection of private, domestic and irrigation water sources are under the control of the landowner, and therefore, depend primarily on education rather than regulation.

The U.S. Geological Survey (USGS, DeSimone et al. 2009) reported that nitrate was the most commonly detected contaminant in private wells derived from man-made sources at concentrations greater than the U.S. Environmental Protection Agency's (EPA) Maximum Contaminant Levels (MCL) for public water supplies. A second finding potentially affecting a greater portion of the population was that total coliform bacteria, a broad group that includes bacteria from soil, water and animal feces, were detected in 34% of sampled wells. The MCL goal for coliform bacteria, including *Escherichia coli*, in drinking water is zero because this group is a predictor of the probable presence of pathogenic bacteria.

These broad findings of the USGS study are similar to those reported in Texas. For 2003–2008, Texas Water Development Board reported that for the 3,861 private water wells sampled, the percentage of wells exceeding the nitrate MCL varied from 2% to 50% each year, depending on which regions of Texas were targeted for sampling (www.twdb.state.tx.us/mapping/). Moreover, results of well screenings conducted by the Texas A&M AgriLife Extension Service from 2003–2009 indicate that about 33% of Texas' private wells contain fecal coliform bacteria.

The two categories of the most common private well pollutants, fecal coliform bacteria and nutrients, also are the most frequent cause of stream impairment or concern in Texas. It is likely that in many cases, local release of fecal coliform bacteria and nutrients is not limited to contamination of the property owner's private well and these contaminants are transported off-site and contribute to pollutant loadings in surface water bodies.

To address these issues affecting both surface water and groundwater, the Texas Water Resources Institute (TWRI) and the Departments of Soil and Crop Sciences (SCSC) and Biological and Agricultural Engineering (BAEN), parts of AgriLife Extension at Texas A&M University, developed the Texas Well Owner Network (TWON) designed to deliver a science-based, community-responsive education curriculum. TWON focused on protecting groundwater quality and aquifer integrity, but also complemented the successful Texas Watershed Stewards program by emphasizing best management practices (BMPs) addressing potential contamination of surface water by sources also contaminating private domestic and irrigation wells and jeopardizing aquifer integrity.

With Clean Water Act 319(h) funding from the EPA through the Texas State Soil and Water Conservation Board (TSSWCB), the *Preventing Water Quality Contamination through the Texas Well Owner Network* program trained Texans regarding water quality and BMPs for protecting their wells and surface waters, which will avert off-site transport of contaminants (bacteria and

nutrients) to surface waters, prevent contamination of underlying aquifers, and safeguard the water quality and health of landowners and their families. As a result, this program supported ongoing watershed protection planning (WPP) efforts being conducted by TSSWCB and others by expanding the reach of these programs to additional audiences and resulting in greater awareness, knowledge and implementation of BMPs for water quality improvement and protection.

Because improved understanding of water quality, human impacts and management practices to improve well and surface water quality help to forestall off-site transport of coliform bacteria and nutrients to surface waters, TWON is an effective tool to be used in support of WPP and total maximum daily load (TMDL) implementation efforts where investigations indicate bacterial and nutrient contributions. This was achieved by (1) development of TWON curriculum; (2) delivery of TWON educational materials and trainings; and (3) evaluation and assessment of the program so that needed modifications and improvements could be made.

TWON Materials

TEX*A*Syst is a series of publications developed in 1996 to help rural residents assess the risk of groundwater pollution, and to describe BMPs that can help protect groundwater. Since the TEX*A*Syst publications were developed roughly 18 years ago, they required updating to reflect current laws and regulations guiding private well maintenance and management, and development of improved BMPs for protecting groundwater. SCSC hired a TWON Coordinator to assist with updating the TEX*A*Syst materials and renamed them to accompany the TWON educational materials.

Additionally, the TWON team developed and adapted other educational resources to create a science-based, community-responsive TWON education curriculum and handbook, which is used to train private well owners.

Finally, to increase delivery of these educational materials to a greater audience, the educational materials were transformed into an online format that is more readily available to the public. These materials are on the TWON website at <http://twon.tamu.edu/publications/>.

TWON Trainings and Screenings

SCSC worked with TSSWCB and other state and local organizations to select locations for well water screenings (*Well Informed*) and trainings (*Well Educated*) to be conducted during this project. SCSC coordinated efforts with organizations already involved in WPP/TMDL processes or that are planning future WPP/TMDL processes.

Through this project, 14 *Well Educated* trainings were conducted with more than 700 private well owners who attended to become familiar with groundwater resources, septic system maintenance, well maintenance, water conservation, water quality and water treatment. In addition, 43 *Well Informed* events were delivered throughout the course of the project to provide wellhead protection information and recommendations for remediating well contamination. Participants could also collect and bring their own well water for analysis. Almost 3,000 water samples were analyzed through the *Well Educated* and *Well Informed* events.

Program Development

Through this project, a TWON Coordinator was hired to lead development of educational materials and curriculum to use in conjunction with the TWON *Well Educated* and *Well Informed* programs. Part of the materials included revising the 18-year-old TEX*A*Syst materials, which were retitled as TWON Fact Sheets and significantly updated to reflect changes/improvements in laws and regulations and private well management, maintenance and protection. Updated publications can be found through the AgriLife Extension bookstore and include:

- [*Private Drinking Water Well Basics \(ESC-013\)*](#)
- [*Storage and Handling of Pesticides to Protect Groundwater \(ESC-016\)*](#)
- [*Improving Petroleum Product Storage \(ESC-017\)*](#)
- [*Managing Hazardous Materials to Protect Groundwater \(ESC-018\)*](#)
- [*Managing Livestock Holding Pens to Protect Groundwater \(ESC-019\)*](#)
- [*Animal Manure Storage to Protect Groundwater \(ESC-020\)*](#)
- [*Managing Fertilizers to Protect Groundwater \(ESC-023\)*](#)
- [*Maintaining Your Septic System to Protect Well Water \(ESC-015\)*](#)

Beyond the Tex*A*Syst materials, additional TWON Fact Sheets were developed:

- [*Hydraulic Fracturing and Your Private Water Well \(ESC-012\)*](#)
- [*Protect Your Water Well During Drought \(ESC-014\)*](#)

A TWON curriculum, including a handbook for participants, standardized presentations for program delivery and program materials for online delivery were developed for use in carrying out the *Well Educated* TWON 6-hour trainings. Specific components of the curriculum include:

- Watershed and groundwater hydrology and the importance to neighbors and the public of safeguarding aquifer integrity and groundwater quality
- Proper siting of drinking water wells and avoiding improper well construction techniques
- Proper maintenance and protection of the wellhead
- Solid and hazardous household waste management
- Aging and failure of wells
- Locating and properly plugging abandoned wells
- Improperly sited and functioning on-site wastewater treatment systems
- Maintenance, aging and failure of on-site wastewater systems
- Water quality assessment and testing
- Effects of land use changes on well water quality
- Options for water treatment
- Successful methods of sharing TWON information with neighbors and community

The TWON handbook, *Texas Well Owner Network: Well Owner's Guide to Water Supply (B-6257)*, is located online [on the TWON website](#), or a hard copy can be ordered [through the AgriLife Extension Bookstore](#).

SCSC, working with BAEN, TWRI, TSSWCB and others, selected priority locations for these events. SCSC coordinated these efforts with state agencies and organizations already involved in WPP/TMDL processes or that are planning future WPP/TMDL processes in specific watersheds.

Implementation

Programs were held in the priority watersheds selected by the TWON team and TSSWCB. With assistance from SCSC, TWRI developed and disseminated informational materials to actively market *Well Informed* water screenings and *Well Educated* TWON trainings including news releases, internet postings, newsletter announcements, public/conference presentations, flyers, etc. TWRI also included information on the TWON program in their *txH2O* magazine, *Conservation Matters* e-letter and helped get releases out through *AgriLife Today* as well as through the TWRI Facebook page and Twitter. In addition, a TWON “Well Read” electronic newsletter was developed and sent out occasionally with updates and links to resources regarding groundwater and wells. As a result of these materials, popular media in the watersheds where these programs were to be held also ran some of these releases. The list of TWON articles that were published can be found in Table 1.

Fourteen *Well Educated* 6-hour TWON trainings were delivered through this project to a total of 745 participants to increase local understanding of the factors that can adversely impact well water quality and provide access to the knowledge and tools that can be employed to prevent and/or resolve them. Trainings were delivered by the TWON Coordinator and a combination of the BAEN and SCSC Program Specialists and the SCSC Assistant Professor and Extension Specialist. The TWON handbook was distributed to all participants, the standardized presentations were delivered, well water samples were collected and analyzed and additional resources such as the TWON Fact Sheets were available in print as well as online.

Well Informed water screening events were delivered to provide wellhead protection information and recommendations for remediating well contamination, as needed. Screenings were delivered by the SCSC Assistant Professor and Extension Specialist, TWON Coordinator and/or the SCSC Program Specialist, as appropriate. While 30 well screening events were in the original scope of work, 43 screening events were delivered during the course of this project. These *Well Informed* screening events included an overview of the topics discussed in more detail during the comprehensive *Well Educated* TWON trainings.

For both *Well Informed* screening and *Well Educated* training events, participants arrive with private well water samples, collected using the Soil, Water and Forage Testing Laboratory water collection procedures (<http://soiltesting.tamu.edu/files/waterweb1.pdf>), which were screened for fecal coliform bacteria, nitrate and salinity concentrations. The participants’ cost for the screenings was typically around \$5–\$15 per sample. For those with positive results, remediation instructions and/or a recommendation and instructions were given for sending follow-up samples to an accredited National Environmental Laboratory Accreditation Conference laboratory to perform drinking water analyses.

During most of the trainings, results of bacterial screenings are not available before the training is completed. Bacterial screening results and, as appropriate, remediation instructions or recommendation for additional testing are forwarded to the participants, which allows participants to receive bacterial screening results privately. As a result of the *Well Educated* training, participants more clearly understand the relationships between practices in or near the well and the quality of water available for drinking and irrigation by their families and by other families pumping from the same formation.

The list of watersheds, dates and locations for the completed TWON *Well Educated* trainings and *Well Informed* screenings are in Tables 2 and 3. In addition, a map showing attendee volumes at each location is in Figure 2.

Evaluation

To measure both knowledge and behavior changes of individuals participating in the program, evaluations were developed and delivered. SCSC developed and delivered pre-test/post-test evaluations to evaluate increased knowledge by participants at TWON trainings regarding program principles, appropriate BMPs and other activities; to address proper private well management; to evaluate participant satisfaction with the program; and to evaluate participant's intentions to change their behavior as a result of the TWON training. Outcomes for the programs are shown below:

Knowledge gained as measured by pre/post-tests administered at the trainings: pre-test scores averaged 54% correct answers, while post-test scores averaged 84% correct.

- Post-training evaluation:
 - 99% of participants were satisfied with the *Well Educated* training.
 - The value of participating in the program as estimated by attendees was an average of \$752 or a total of \$1,331,810 for all 2013 participants.
- Intentions to Adopt Behavior Change:
 - 86% of participants will test their well annually.
 - 85% of participants will pump their septic system regularly.
 - 94% of participants will remove hazards from their well house.
 - 88% of participants with a deteriorated or open well will plug or cap the well.

In addition, a 6-month follow-up survey was developed and delivered online to assess behavior changes adopted and other activities, such as the number of neighbors contacted, by TWON training participants. The online survey link is emailed to past participants 6 months after attending the training. SCSC analyzes the results using descriptive, correlational and analysis of variances statistical procedures. Outcomes from the 6-month follow-up are shown below:

- Six-month follow-up survey results:
 - 74% shared the resources/materials with others who were not at the training.
 - 89% of those needing to clean out hazards from their well house had done so.
 - For participants with septic tanks that needed pumping, 55% had pumped their septic tanks within 6 months following the program. An additional 28% were planning to have their tanks pumped soon.
 - 38% of participants with unused/deteriorated wells had plugged those wells as a result of the TWON program, and another 25% planned to plug their unused/deteriorated wells soon.
 - 71% of participants who had wells near contamination sources (pet shelters, livestock yards, etc.) moved the sources following the program, and another 29% had plans to move sources soon.

Conclusion

The development and implementation of the TWON *Well Educated* trainings and *Well Informed* screenings was and continues to be highly successful. The materials developed during this project, such as the TWON Fact Sheets and handbook, were and continue to be used for trainings and screenings to help educate landowners on how to protect and manage their well water.

Through this initial project, *Well Educated* trainings were delivered to 745 participants to increase local understanding of factors that can adversely impact well water quality and provide access to the knowledge and tools that can be employed to prevent and/or resolve them. The TWON handbook was distributed to all participants, standardized presentations were delivered, water well samples were collected and analyzed and additional resources such as the TWON Fact Sheets are available in print or online. As a result of the *Well Educated* training, participants have the ability to clearly understand the relationships between practices in or near the well and the quality of water available for drinking and irrigation by their families and by other families pumping from the same formation.

Well Informed water screening events were delivered to provide wellhead protection information and recommendations for remediating well contaminates. There were 43 screening events delivered during the course of this project including more than 2,900 water samples.

Evaluations were given to all participants to measure both knowledge and behavior changes of individuals participating in the programs. A pre-test/post-test was developed and delivered. Outcomes showed that most participants were satisfied with the events and the majority of participants intend to adopt behavior changes, such as testing their well water annually, pumping their septic system regularly, removing hazards from their well house and plugging or capping deteriorated or open wells.

In addition, 6-month follow-up surveys showed that 74% of participants had shared the resources and materials with others who were not at the training. Also, most of those participants needing to clean out hazards from their well house had already done so. For participants with septic tanks needing to be pumped, 55% had them pumped within the 6 months, and an additional 28% were still planning to have them pumped soon.

The efforts above are continuing and expanding through TSSWCB project 13-08 “*Statewide Delivery of the Texas Well Owner Network.*”
